

**Glucose Absorption
And
Glycogen Metabolism**

Starch Digestion

Starch (1000's of residues)

**α -amylase
in saliva**

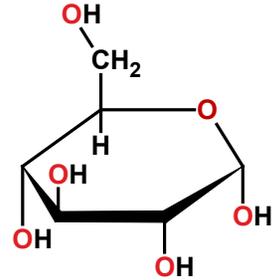

Starch (average of 8 residues)

**α -amylase
inactivated
in stomach**

Starch (in Small Intestine)

**pancreatic
 α -amylase**

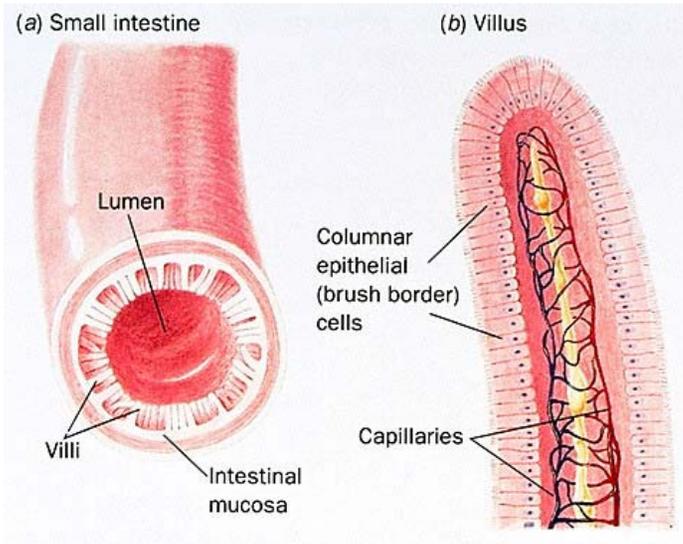

Glucose

Specific enzymes

dextrins
maltose

Glucose Absorption from Small Intestine

(c) Glucose transport

Glucose Transporter

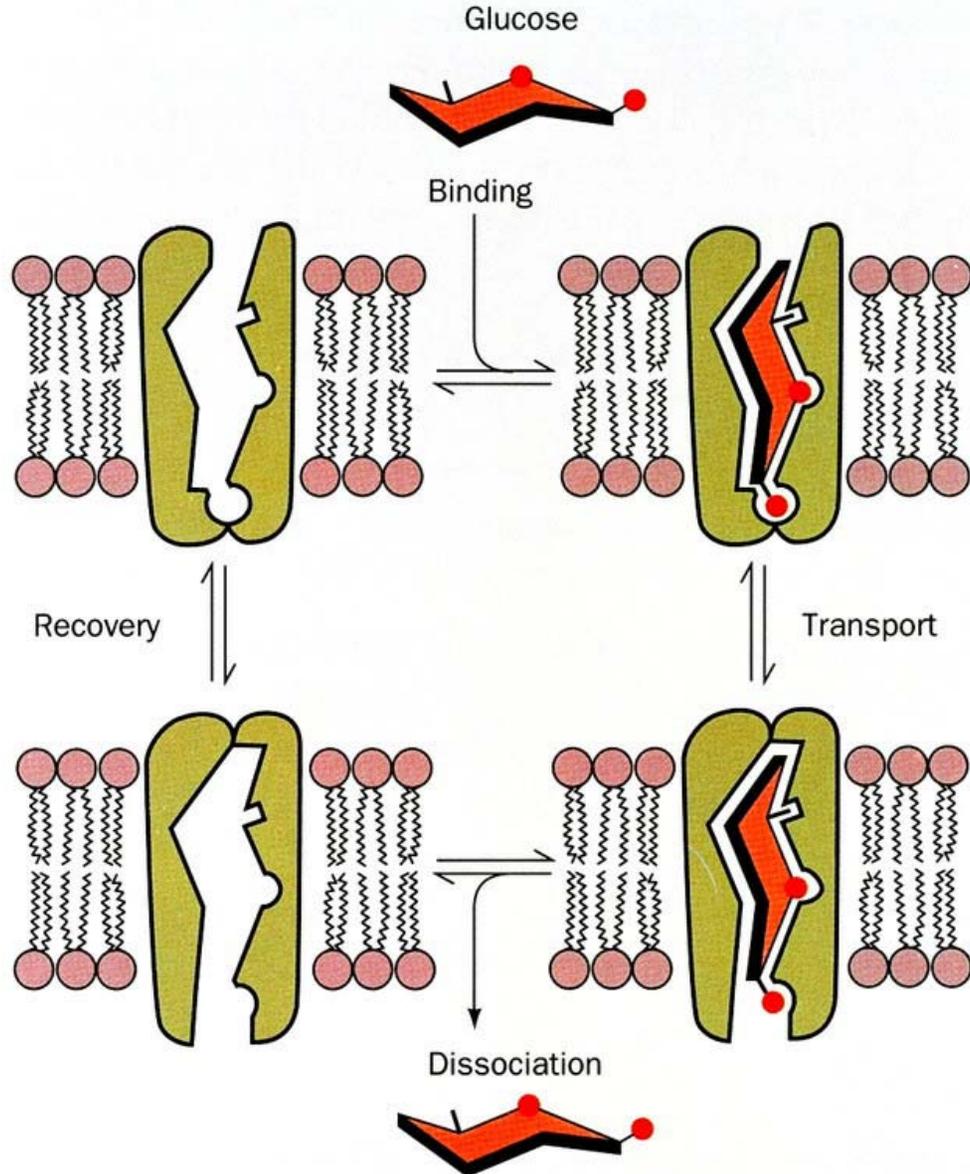

Fig 18.15

Glycogen Structure

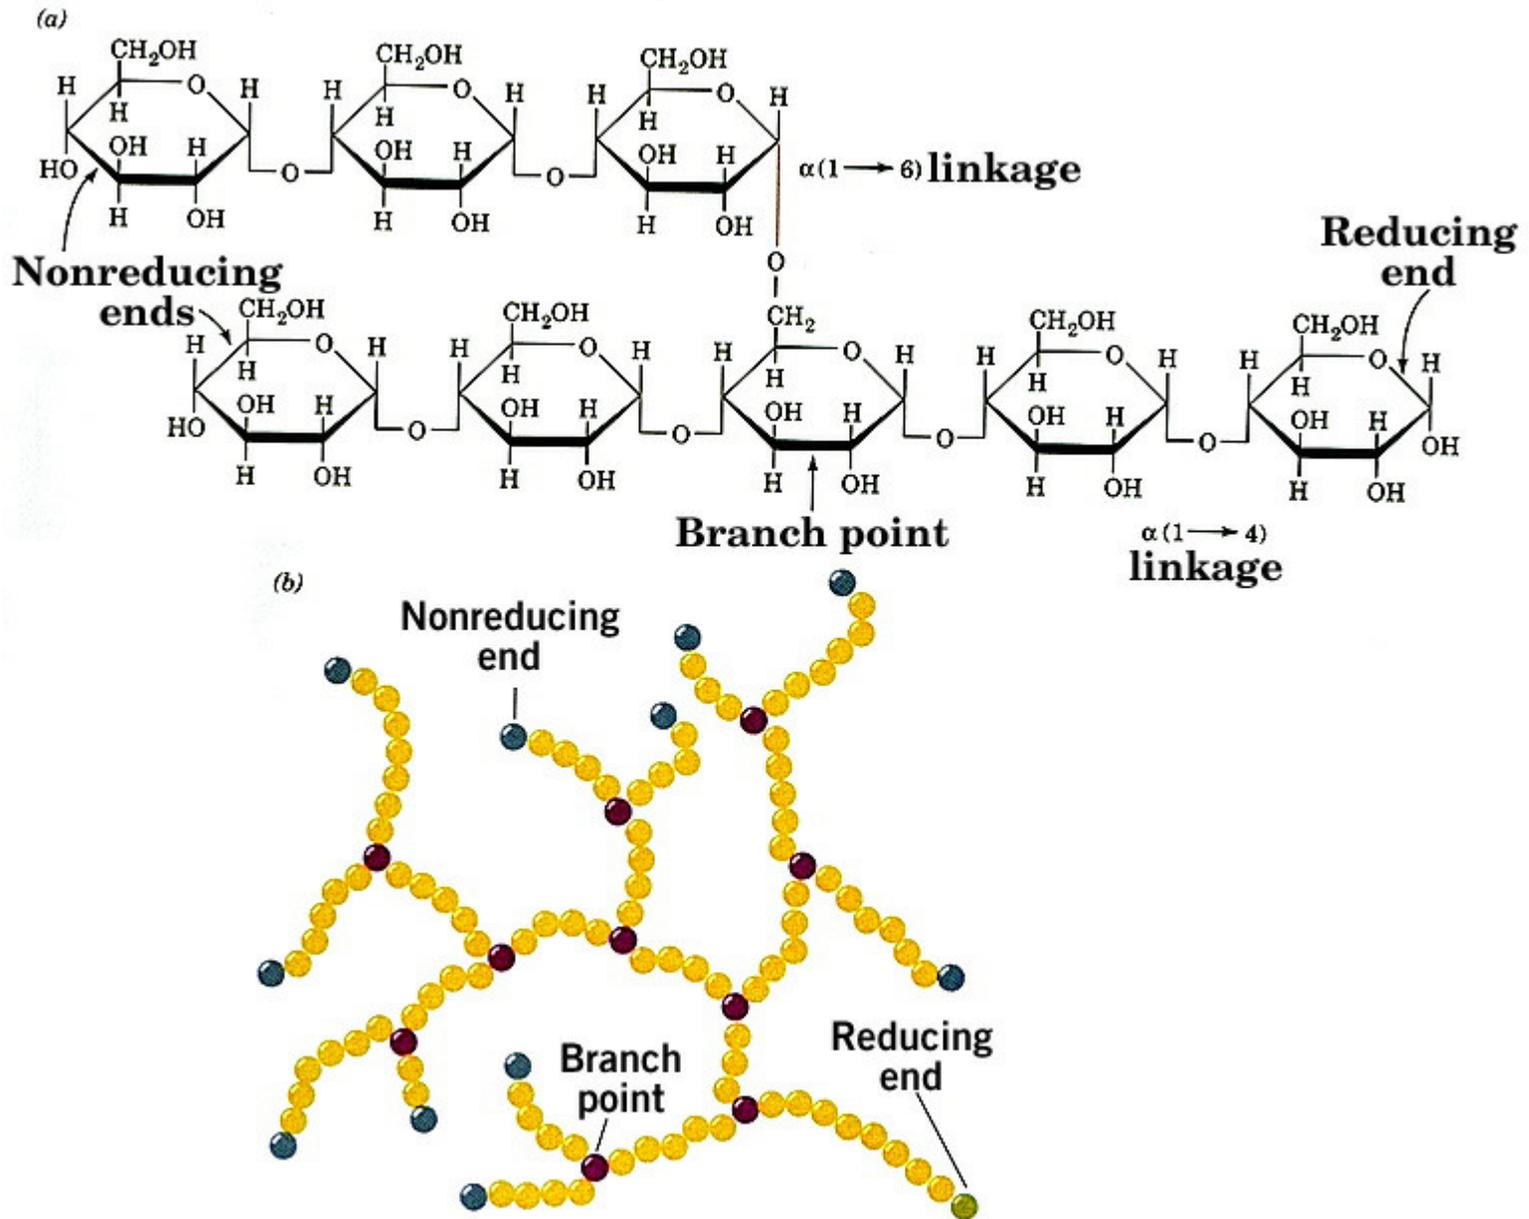

Fig 17.1

Glycogenesis

(Glycogen Synthesis)

Five steps:

1) Hexokinase ($G \longrightarrow G6P$)

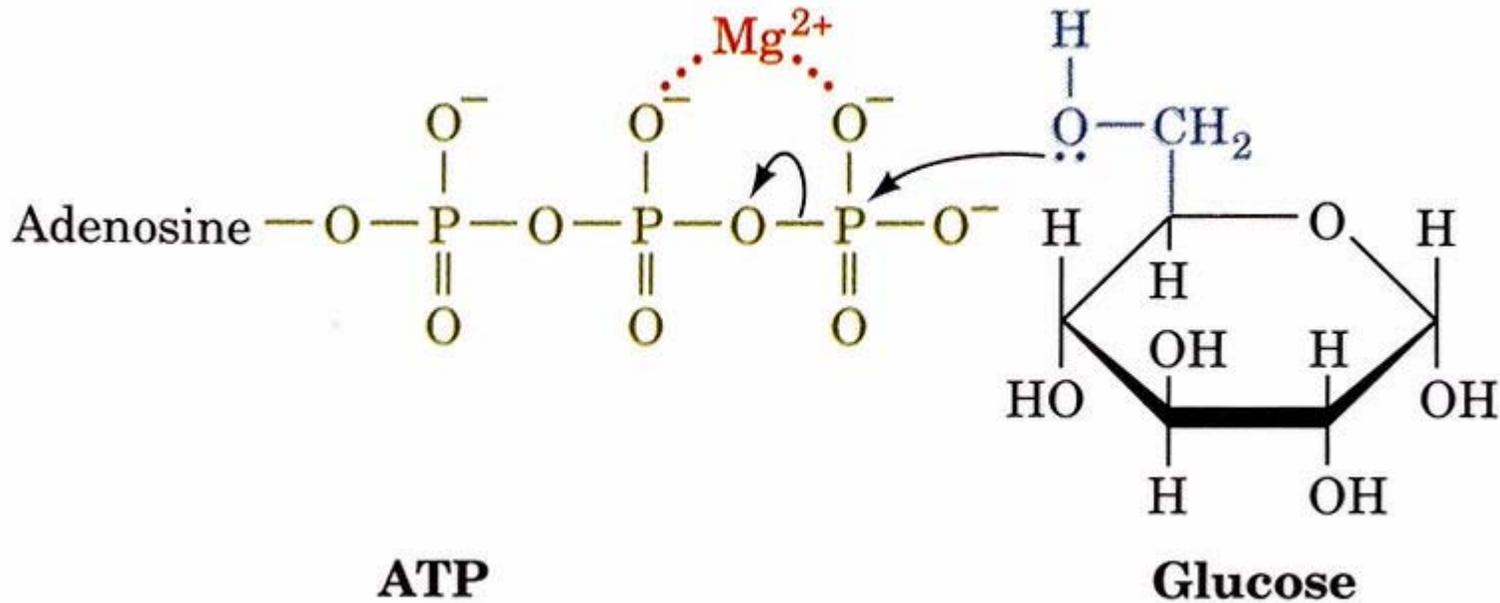

2) Phosphoglucomutase ($G6P \rightleftharpoons G1P$)

3) UDP-glucose Pyrophosphorylase
($G1P + UDP \longrightarrow UDP\text{-Glucose}$)

4) Glycogen Synthase* (regulated step)

5) Branching Enzyme

Step 1: Hexokinase and Hexokinase D

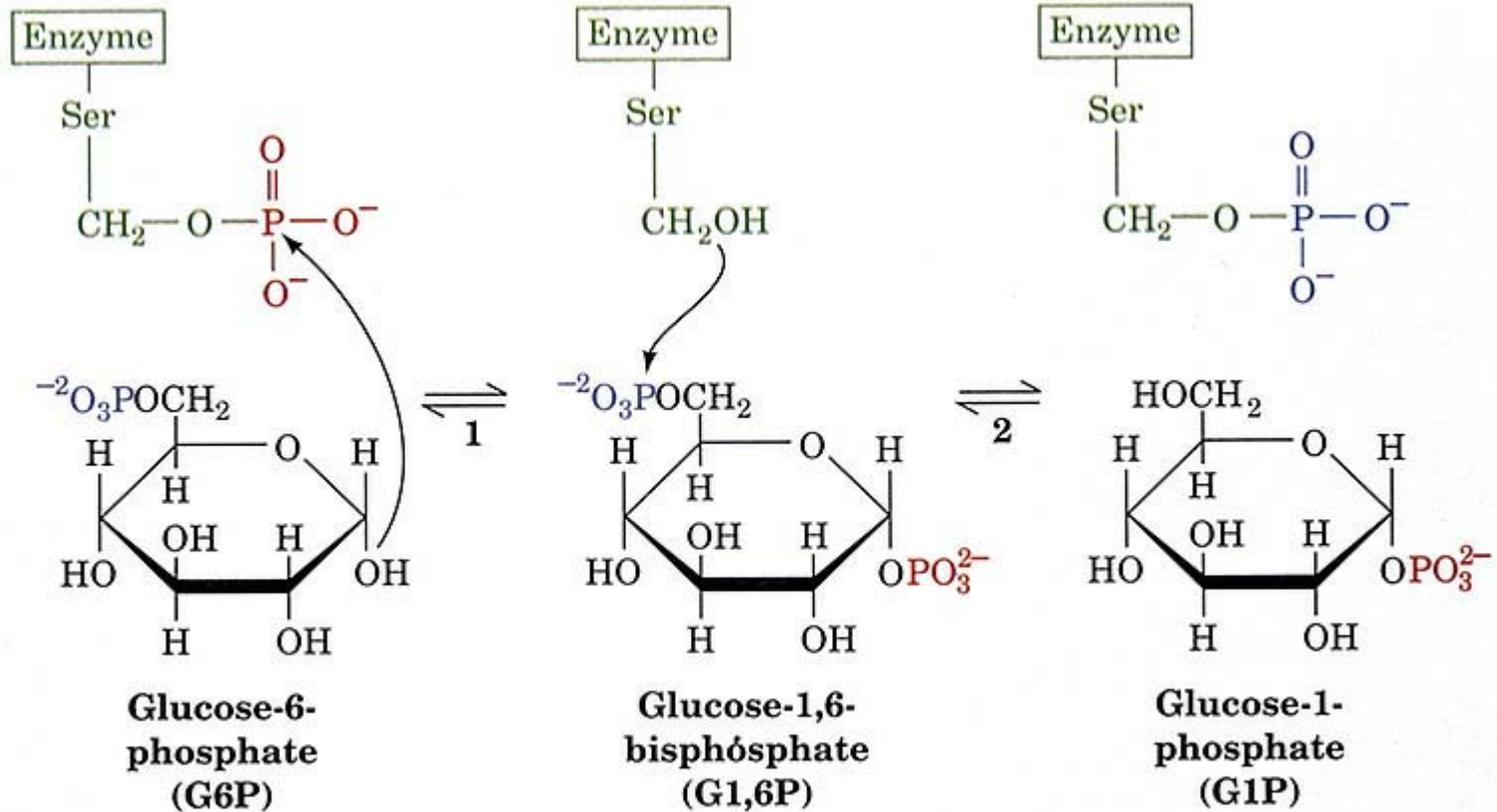

Hexokinase is in all cells except liver
inhibited by G6P

Hexokinase D is in liver
not inhibited by G6P

Step 2: Phosphoglucomutase (PGM)

Reversible

Used in both glycogen synthesis and breakdown

Step 3: UDP-Glucose Pyrophosphorylase

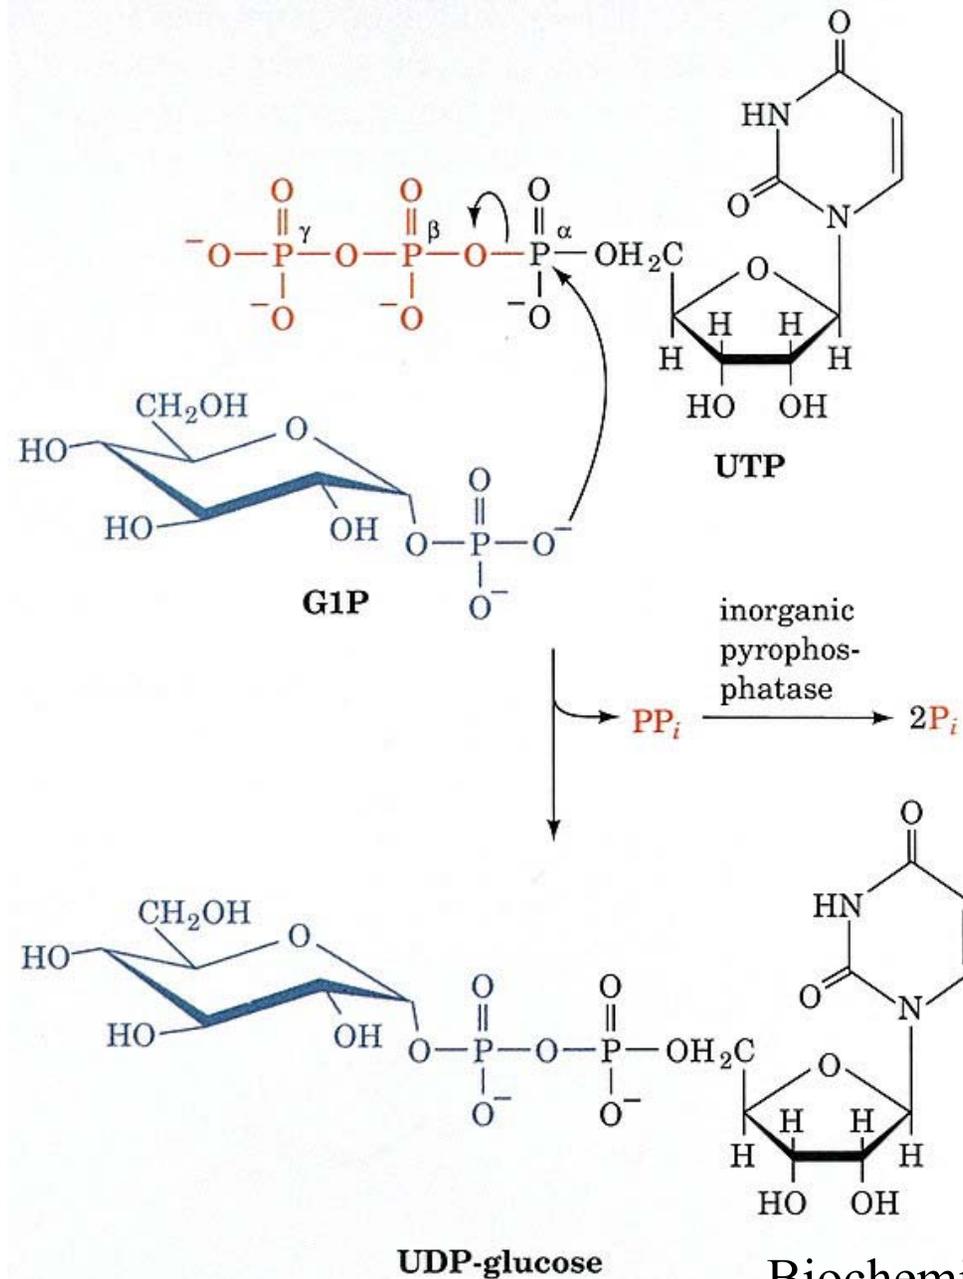

Fig 17.6

Step 4: Glycogen Synthase

Transition State

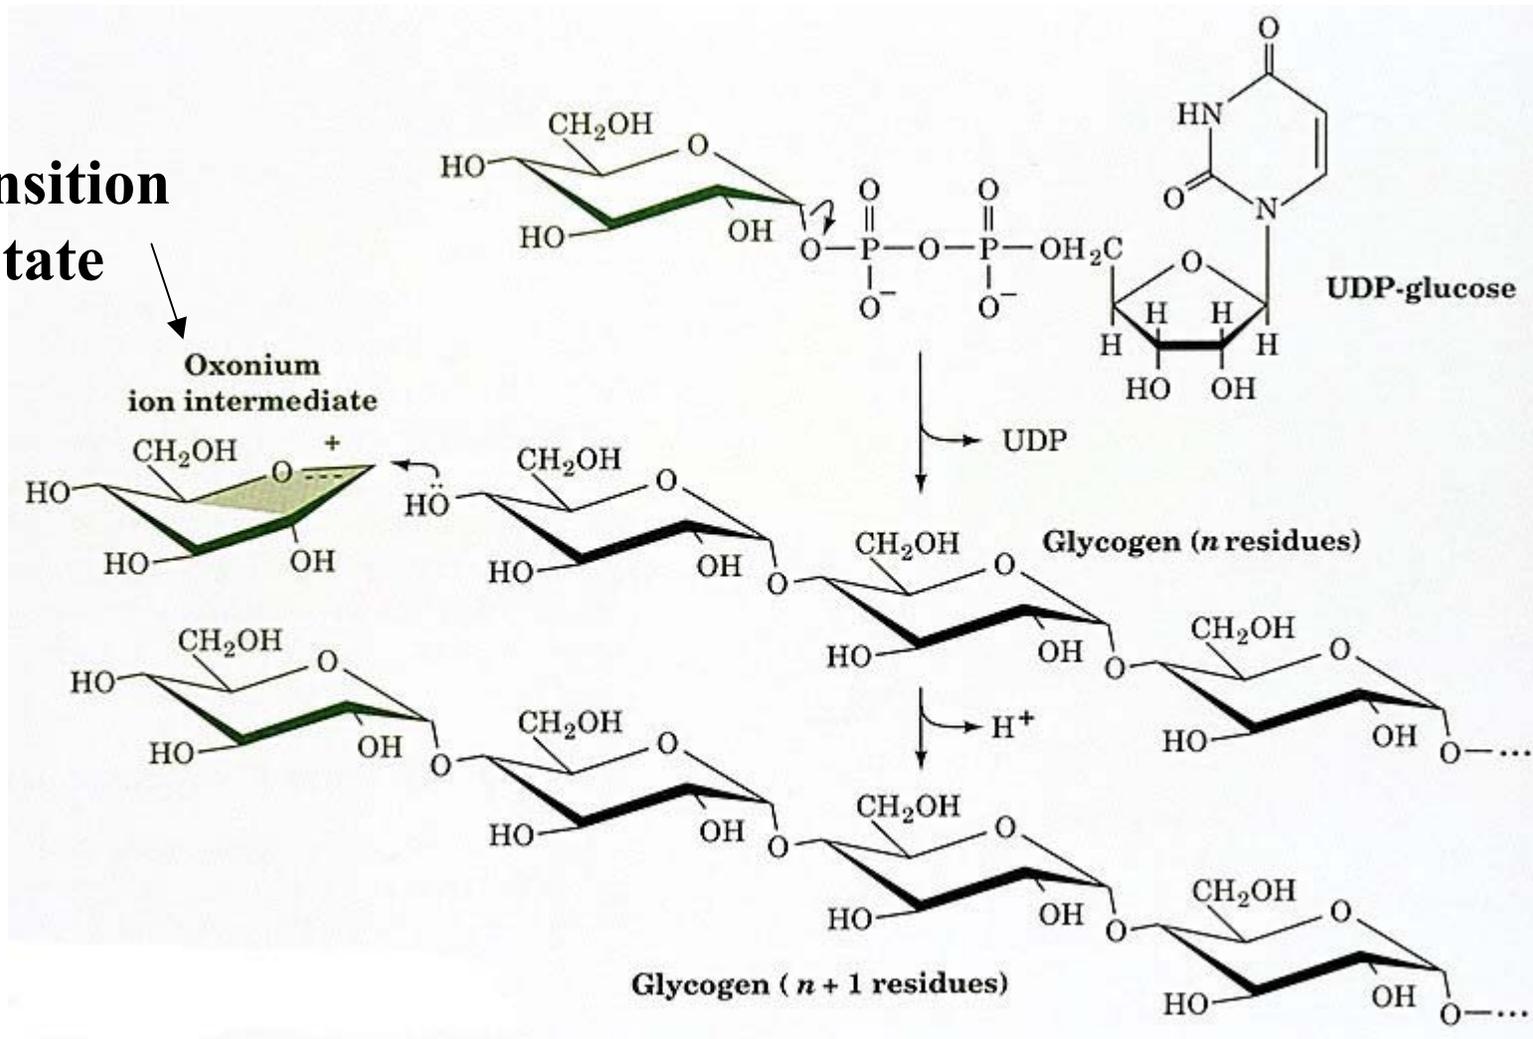

Fig 17.7

Step 5: Branching Enzyme

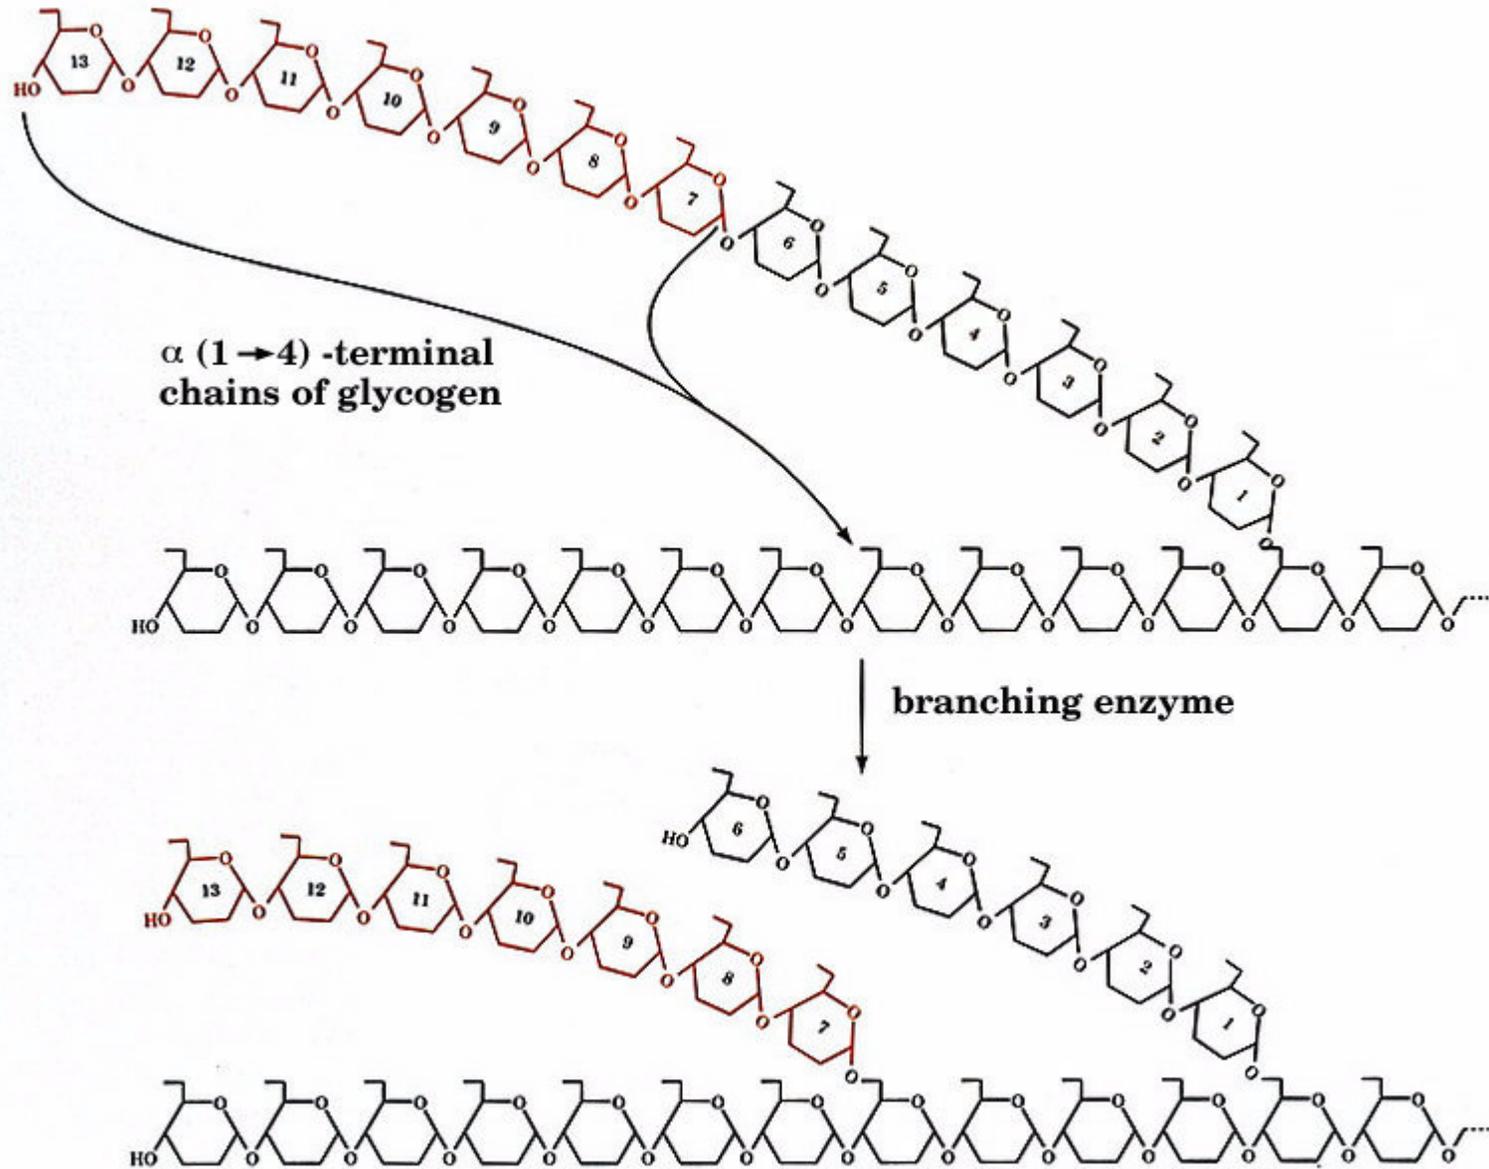

Fig 17.8

Glycogenolysis (Glycogen Breakdown)

4 Steps:

1) Glycogen Phosphorylase* (regulated step)

2) Phosphoglucomutase ($G1P \rightleftharpoons G6P$)

3) Debranching Enzyme

4) Glucose-6-phosphatase ($G6P \longrightarrow G$)
(only in liver)

Step 1: Glycogen Phosphorylase

PLP is a cofactor

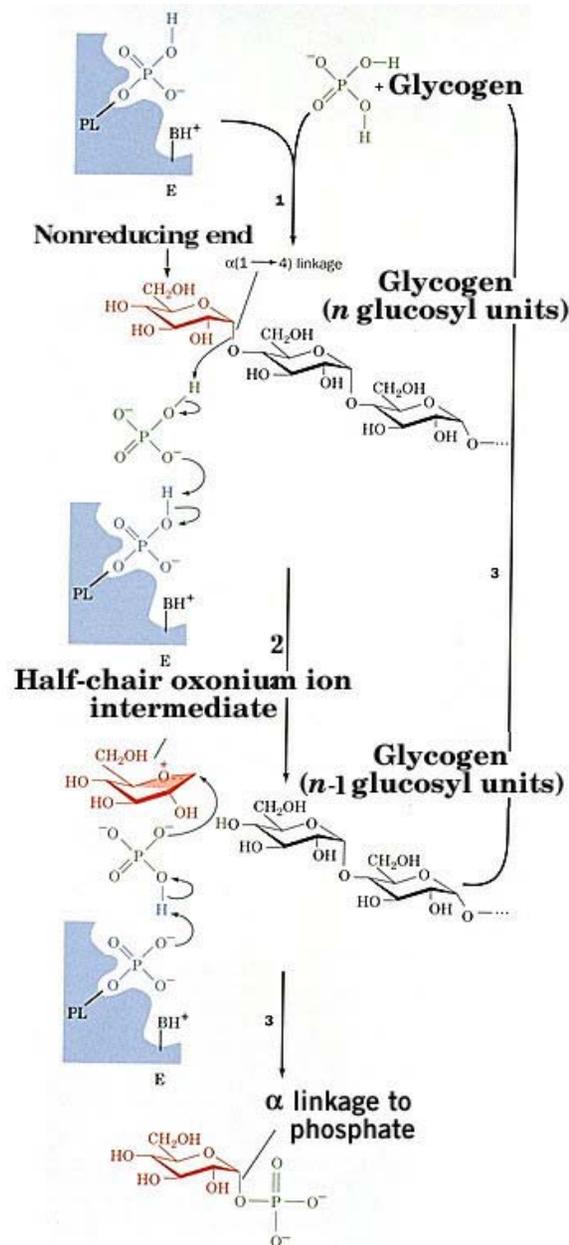

Fig 17.3

Step 2: Phosphoglucomutase (PGM)

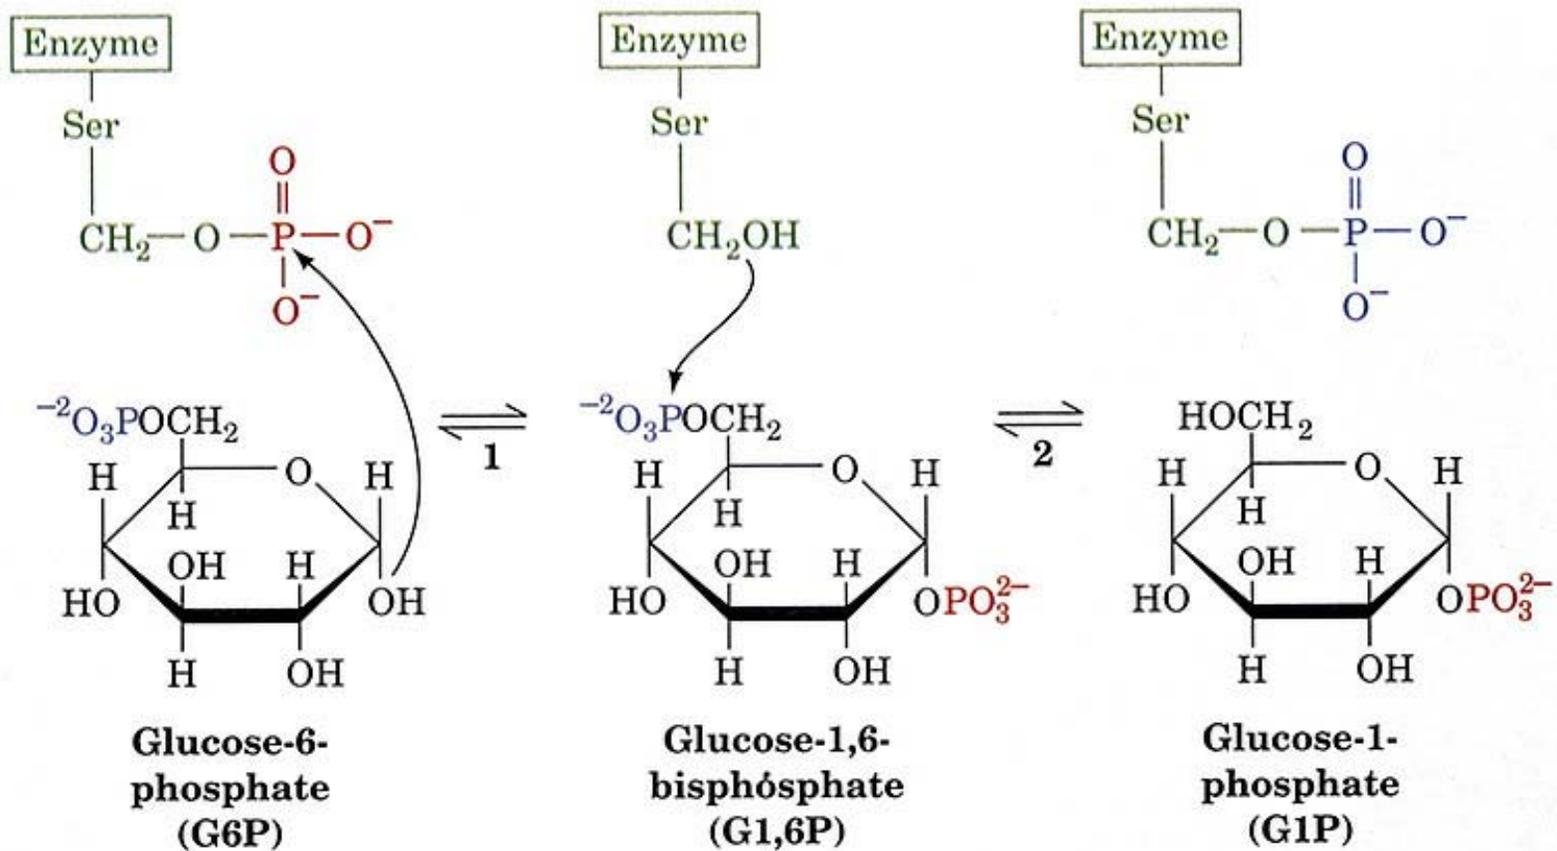

Fig 17.4

Step 3: Debranching Enzyme

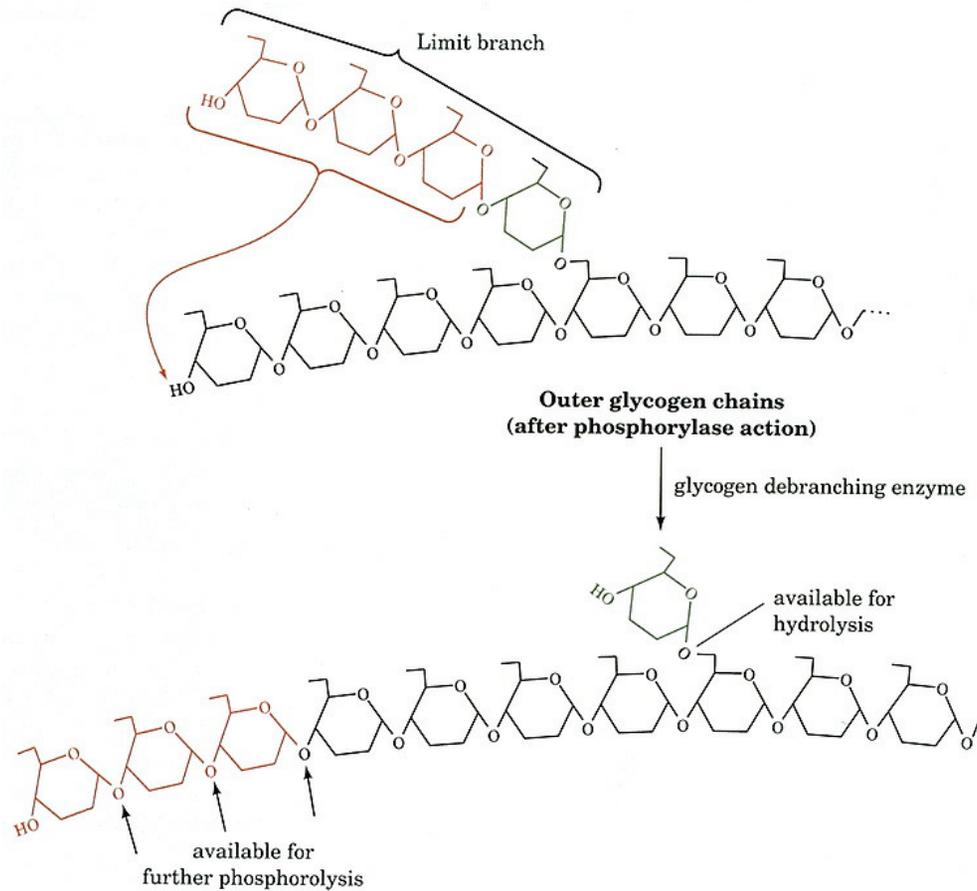

Fig 17.5

Step 4: Glucose-6-phosphatase

Only happens in Liver
