

## Free Fall With Air Resistance

Falling mass subject to gravity and air resistance

Air resistance  $f = bv^2$ , where  $b$  = drag coefficient

### Initial Parameters

to be set by user

delta_t =	0.002	time increment (s)
g =	9.8	gravity (m/s <sup>2</sup> )
m =	1	mass (kg)
b =	5	drag coefficient
v_i =	-3	initial velocity (m/s)

Acceleration:  $a = g \pm f/m = g \pm (b/m)v^2$

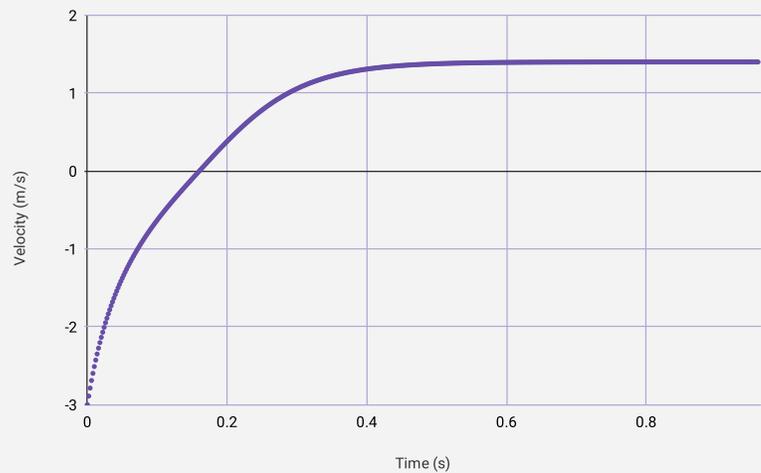

Velocity:  $v_2 = v_1 + a\Delta t = v_1 + (g \pm (b/m)(v_1)^2)\Delta t$

Displacement:  $y_2 = y_1 + [(v_2 + v_1)/2]\Delta t$

Calculate assuming DOWN is the (+) direction
