The grey line represents the average rate of change.

$$\frac{\Delta y}{\Delta x} = \frac{2 - (-1)}{4 - 1} = \frac{3}{3} = 1$$

It’s an estimate, so anything on the interval $\left[\frac{1}{2}, 3\right]$ was given full credit.

Question 15 r=0.273, p=0.2893
16) Find \( \frac{dy}{dx} \), given that \( xy^2 + \sin(y) = x^4 + 2 \)  

\[
\frac{d}{dx} (xy^2 + \sin(y)) = \frac{d}{dx} (x^4 + 2)
\]

\[
y^2 + 2xy \frac{dy}{dx} + \cos(y) \frac{dy}{dx} = 4x^3
\]

\[
2xy \frac{dy}{dx} + \cos(y) \frac{dy}{dx} = 4x^3 - y^2
\]

\[
\frac{dy}{dx} (2xy + \cos(y)) = 4x^3 - y^2

19) This problem is intended to test your conceptual understanding of the formal definition of a limit. We covered this in class using what we called the “ε – δ” game. Below is a graph of a function. At \( x = 2 \), we think that the limit is \( \lim_{x \to 2} f(x) = 3 \). Today, our notion of closeness on the y-axis will be \( \varepsilon = \frac{1}{2} \), so we must force \( f(x) \) to be within \( \frac{1}{2} \) units of 3. This is illustrated using the dotted lines on the graph below.

Find the corresponding notion of closeness on the x-axis that is required, and illustrate it on the graph. (6.5 points)

\[ \delta = 1 \]
Mathematical Grammar: Points taken off for notational, poor illustration of work, etc:

These were marked in green
Instead of taking points off of the problem itself, they’re pooled together with a cap at -5% – because you might make the same mistake on a dozen problems, such as not writing limit or equating numbers and variables.

However, that cap will increase for subsequent tests:
- 5% cap on test 1
- 10% cap on test 2
- 15% cap on test 3
- 20% cap on the final exam

In particular, if you’re adding up your grade to verify the final score, add up the points for all the problems, and then subtract the points deducted in pink – but don’t subtract more than 5 even if more are marked.
